Problem: Model Driven Performance Engineering

- **GOAL:** Supporting Performance Engineering (PE) of distributed component-based applications in Model Driven Processes;
- **SAP•one** (Software Architecture Performance Analysis) and **PRIMA-UML** (PeRformance IncreMental vAlidation in UML) are two methodologies supporting PE for component-based systems;
- **MOSQUITO** (MOdel driven conStruction of QUeuIng neTwOrks) is a web service **CASE** tool for SAP•one and PRIMA-UML. It allows the automated generation of XML-based performance models (EG, QN) starting from an EclipseUML-based system design model.

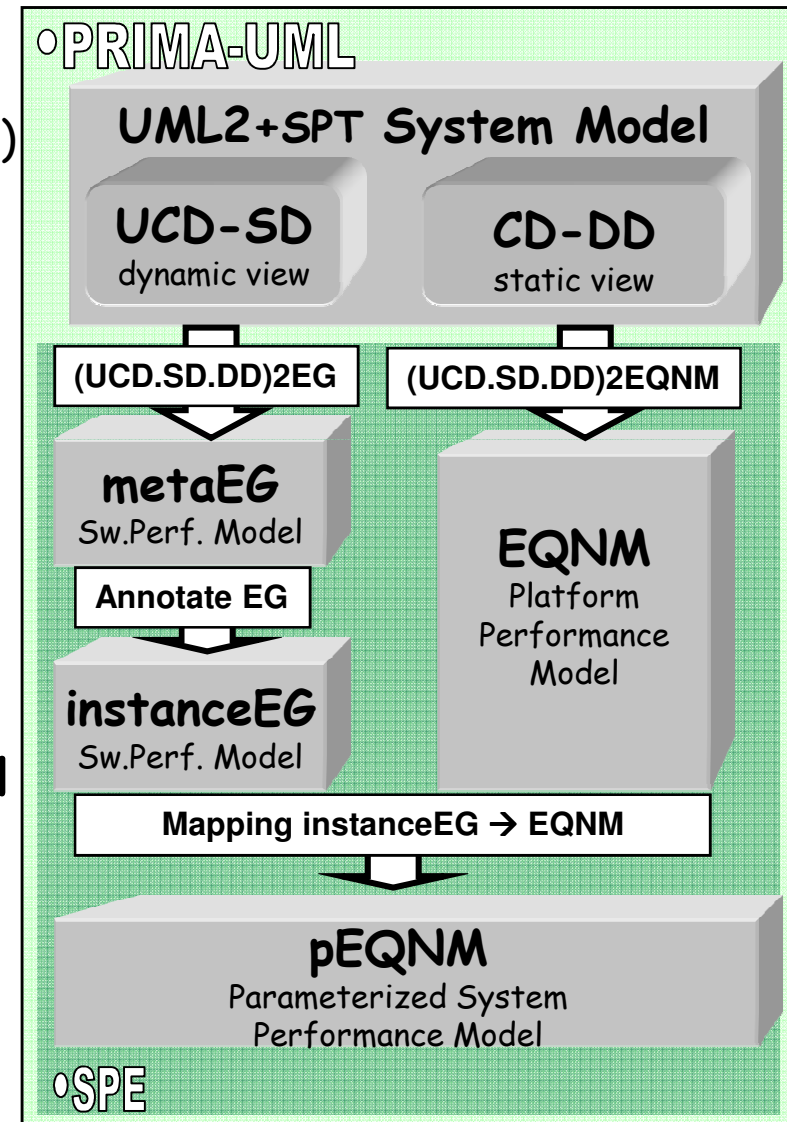

The Methodologies: SAP·one

- **INPUT:**
 - **UML Design Model** representing a **Software Architecture**
(Component and Sequence Diagrams)
 - Performance additional info
(by PApofile \subset UML SPT)
- **OUTPUT:**
 - **Queuing Network Model (QNM)**
representing an Architectural
Performance Model
(Service Center = UML Component)
- **GOAL:** It allows to distinguish
different architectural choices

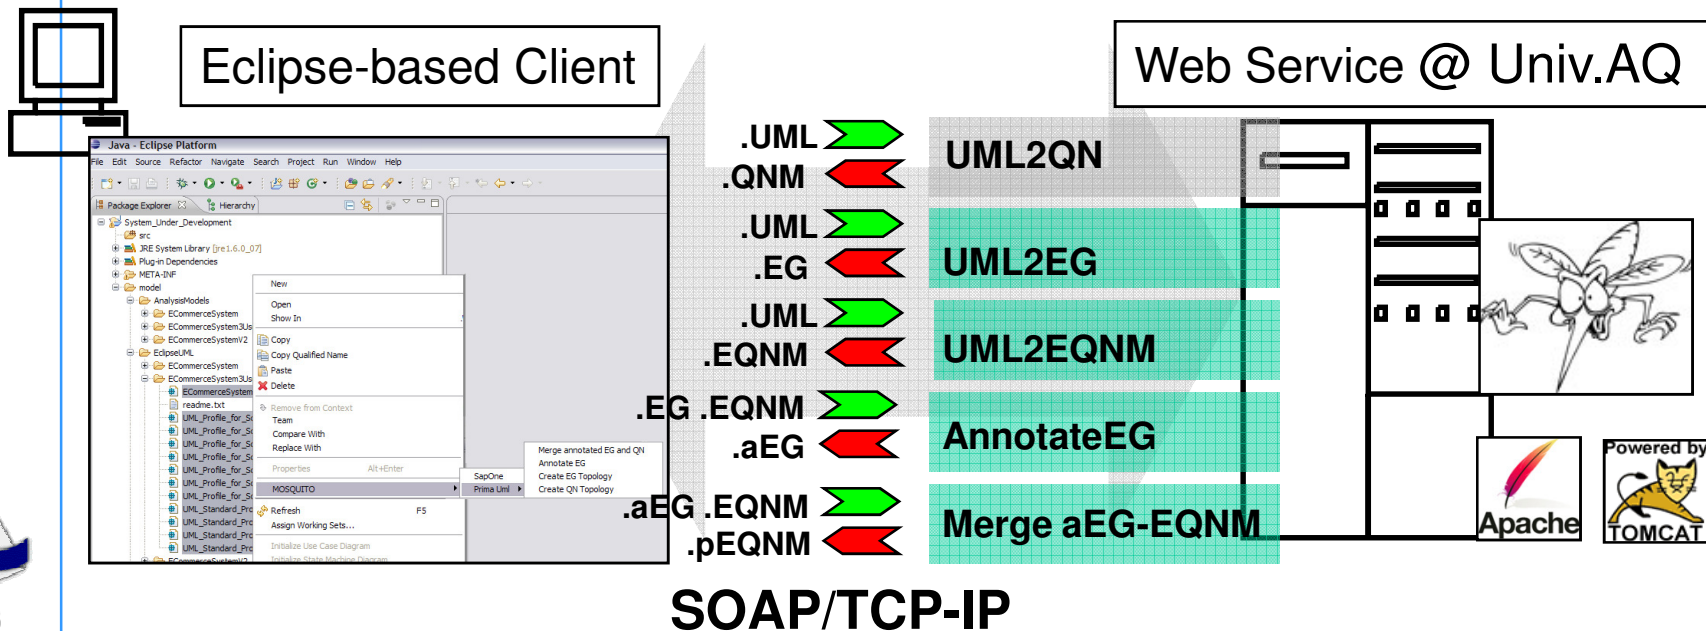

The Methodologies: PRIMA-UML

- **INPUT:**
 - UML System Model (UCD, CD, SD, DD)
 - Performance additional info (by Paprofile \subset UML SPT)
- **INTERMEDIATE MODEL:**
 - Execution Graphs: flows of component operation invocations (metaEG) and sw resource consumption (instanceEG)
- **OUTPUT:**
 - Extended Queuing Network Model (Service Center = Hw resource)
- **GOAL:** It allows to distinguish different system (hw/sw) configurations.

MOSQUITO for SAP·one and PRIMA-UML

- MOSQUITO is a Web Service CASE tool.
- Its client-side is a Eclipse plug-in that invokes remote model2model transformations on the server-side located at University of L'Aquila.

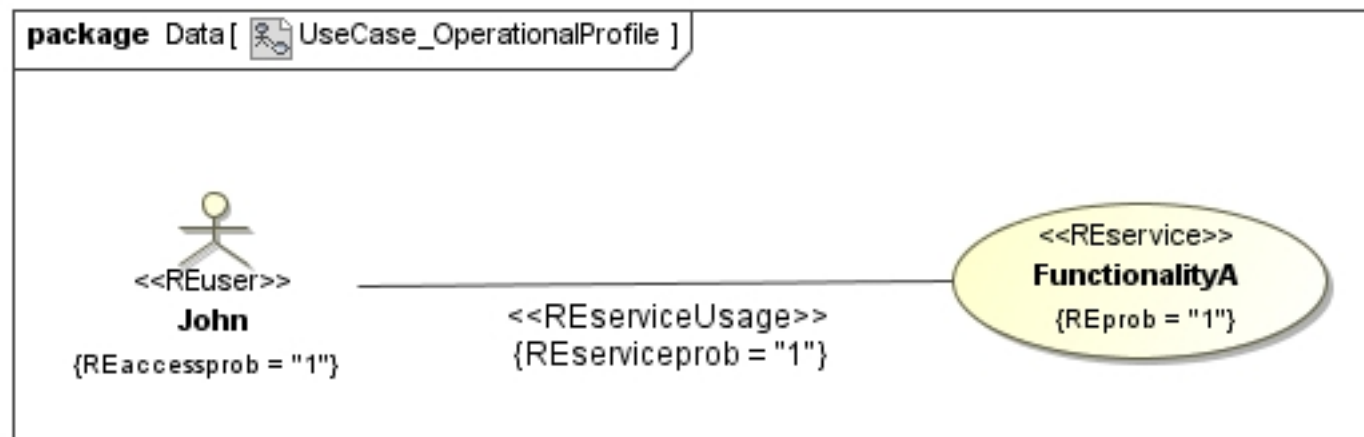

SOAP/TCP-IP

Conclusions and Future Works

- Replace SPT with **MARTE**.
- Adoption of a Model Management Platform (an Eclipse-based one, e.g. **AMMA**);
- Using a DSL for model2model transformation specification in place of OO Programming Languages (e.g. replace Java with **ATL**)
- Integrating MOSQUITO with other Model Generator Tool for **other Non Functional Analyses** (e.g Reliability using the **DAM** (sub)profile for MARTE);
- Integrating analysis results interpretation.

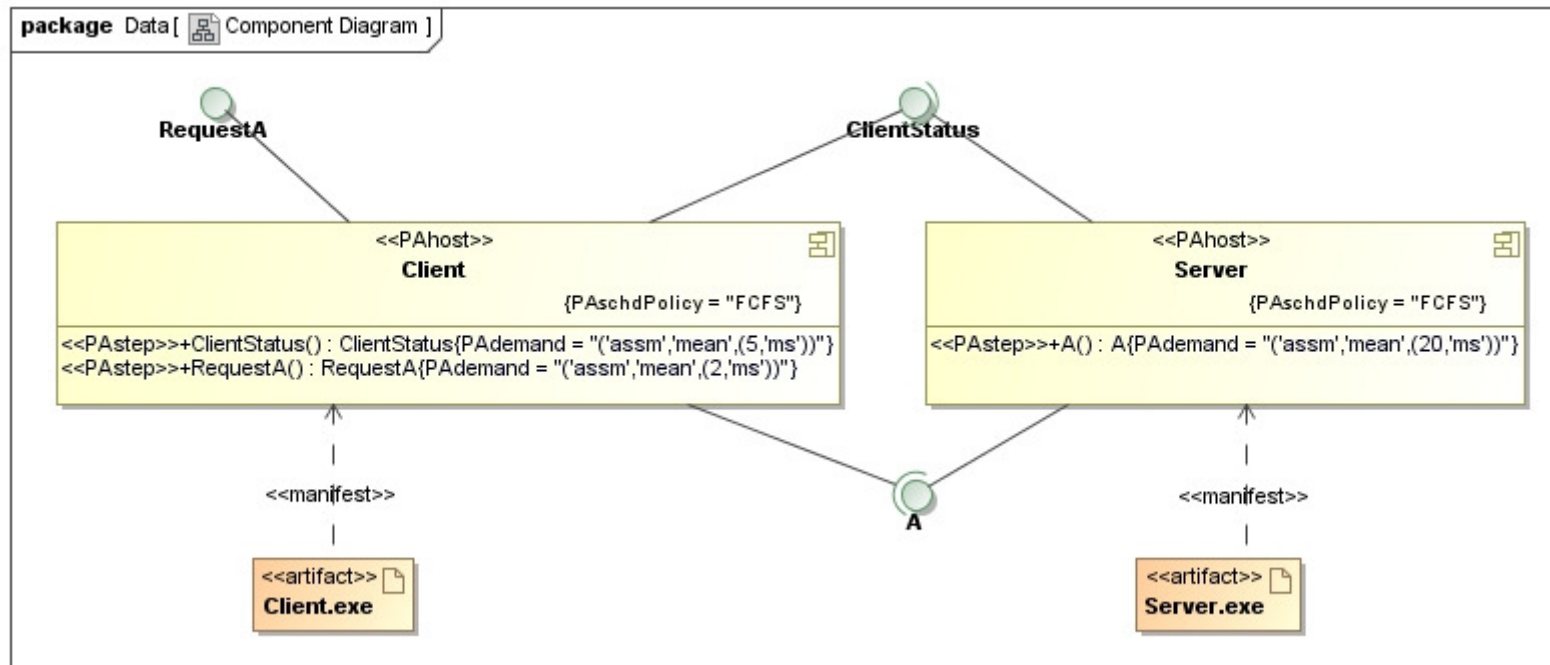

Example 1: MagicDraw UML Model

- **Step 1: Use Case Diagram with Operational Profile**

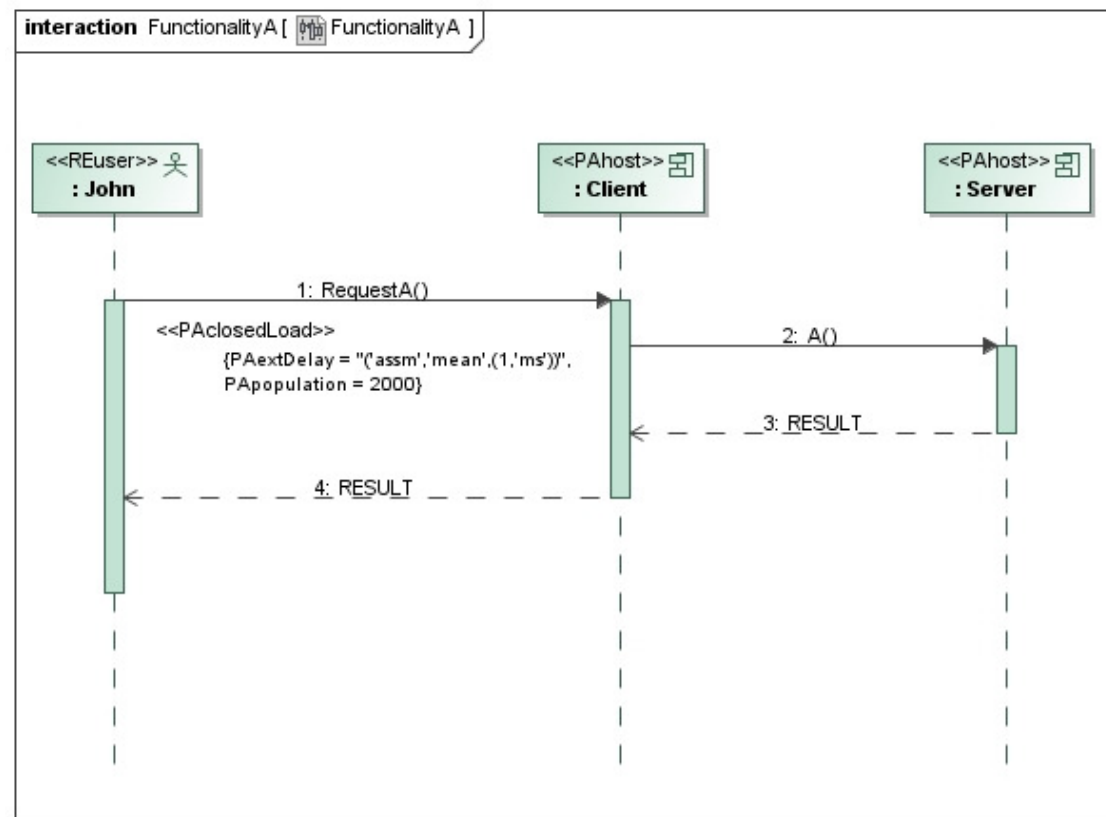

Example 1: MagicDraw UML Model

- Step 2: Component Diagram with Performance characterization of Components

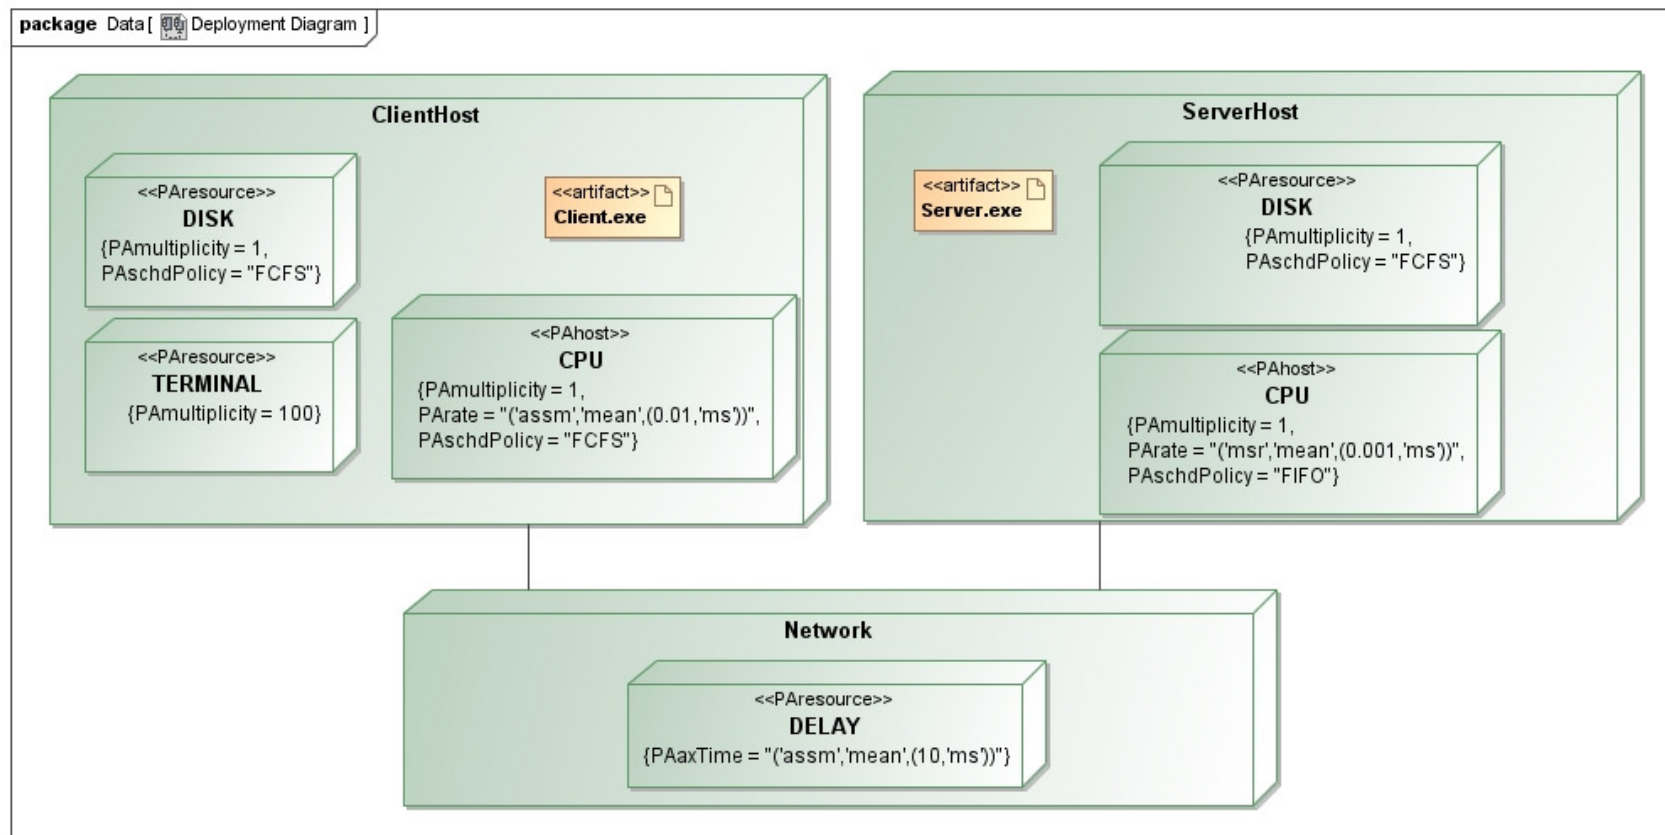

Example 1: MagicDraw UML Model

- **Step 3: Sequence Diagram for each functionality with workload definition.**

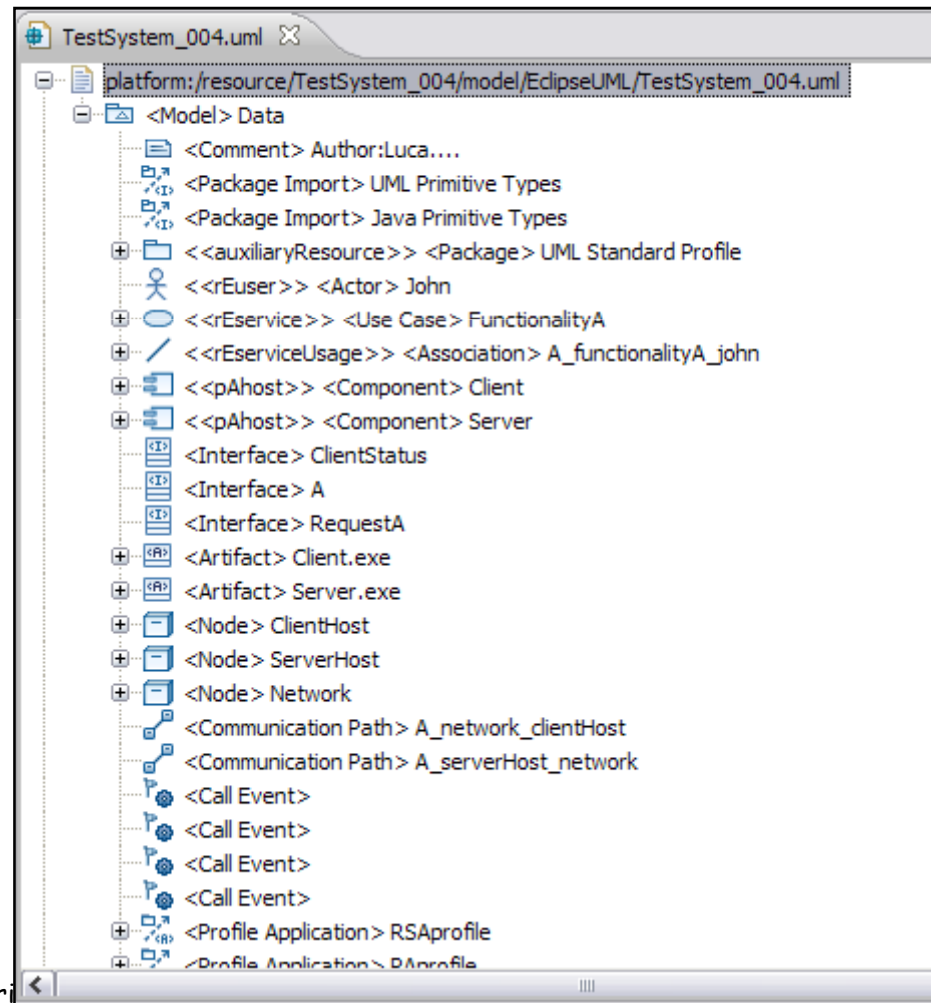

Example 1: MagicDraw UML Model

- **Step 4: Deployment Diagram with hardware resources specifications.**

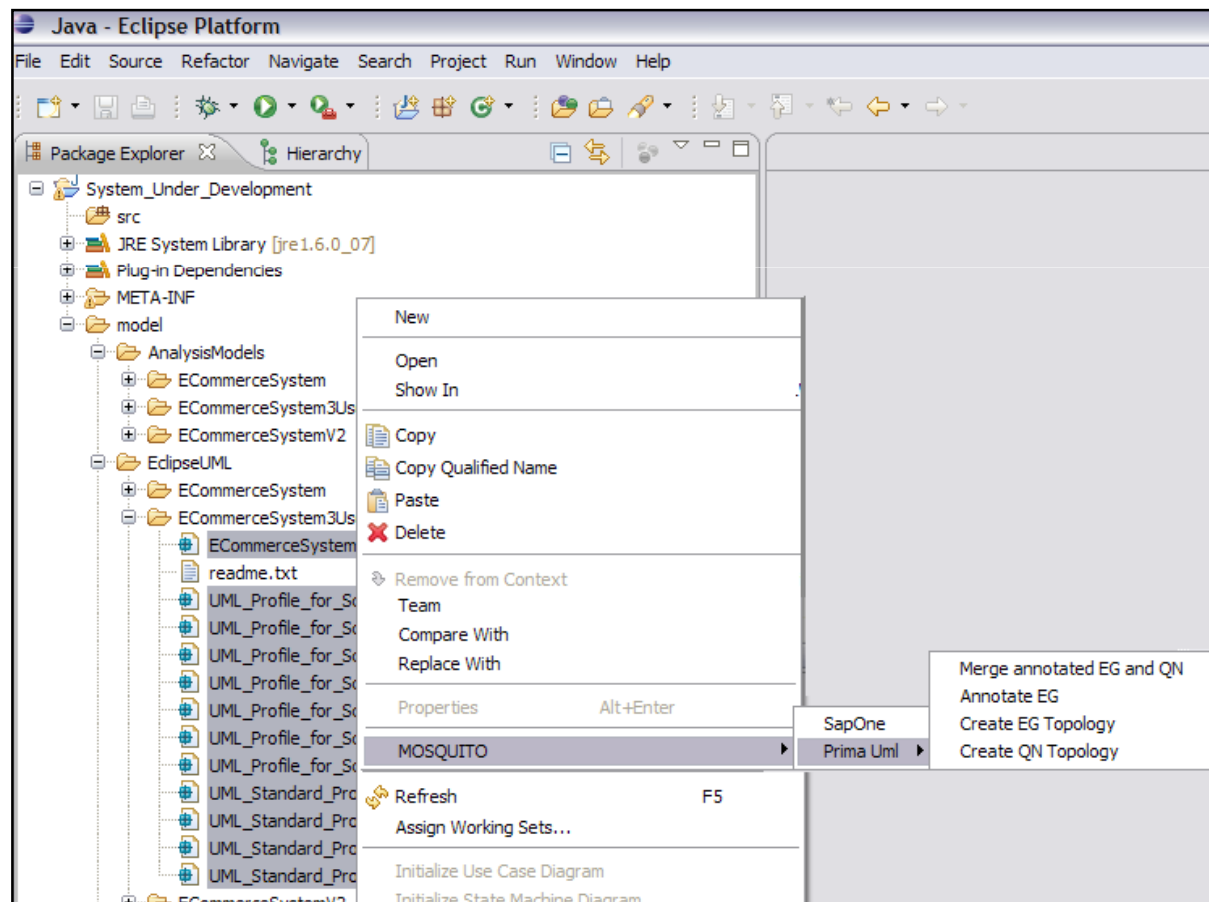

Example 1: Eclipse UML Model

- Step 5: Save UML Model as Eclipse UML one (.uml)

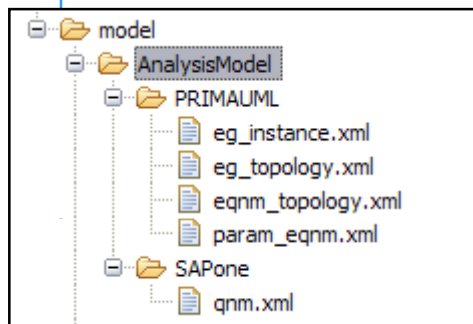

Example 1: MOSQUITO Client

- **Step 6:** Invoke UML2AnalysisModels remote transformations through MOSQUITO Client Eclipse plug-in.

Example 1: MOSQUITO Client

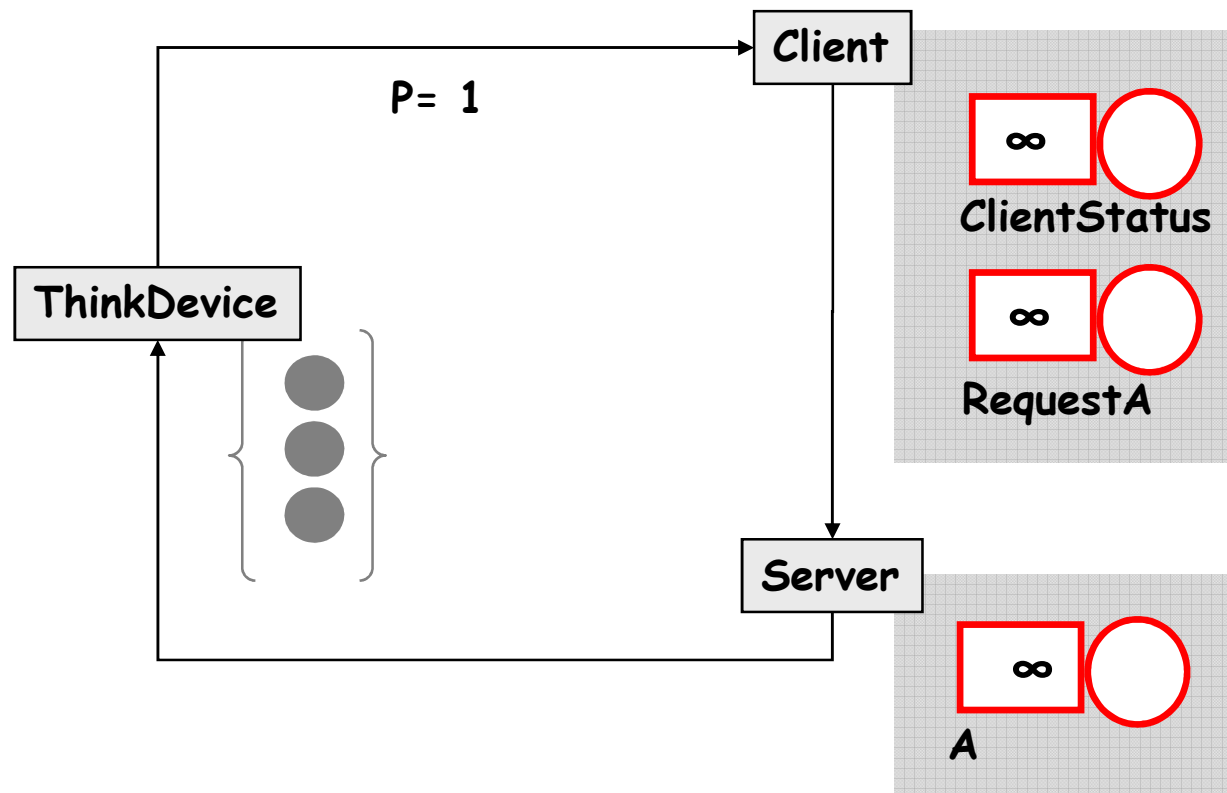

- **Step 7: Save XML-based Analysis Models according to the applied performance methodology.**

```
param_eqnm.xml
<?xml version="1.0" encoding="UTF-8"?>
<QueueingNetworkModel xmlns:xsi="http://www.w3.org/2001/XMLSchema"
  <Node>
    <WorkUnitServer Name="ClientHost_CPU_0" Quantity="1" Sched
    <Server Name="ClientHost_DISK_0" Quantity="1" SchedulingPo
    <Server Name="ClientHost_TERMINAL" Quantity="100" Scheduling
    <WorkUnitServer Name="ServerHost_CPU_0" Quantity="1" Sched
    <Server Name="ServerHost_DISK_0" Quantity="1" SchedulingPo
    <WorkUnitServer Name="Network_DELAY_0" Quantity="1" Schedu
    <SourceNode Name="Init"/>
    <SinkNode Name="Fini"/>
  </Node>
  <Arc FromNode="ClientHost_CPU_0" ToNode="Network_DELAY_0"/>
  <Arc FromNode="ClientHost_CPU_0" ToNode="ClientHost_DISK_0"/>
  <Arc FromNode="ClientHost_DISK_0" ToNode="ClientHost_CPU_0"/>
  <Arc FromNode="ClientHost_CPU_0" ToNode="ClientHost_TERMINAL"/>
  <Arc FromNode="ClientHost_TERMINAL" ToNode="ClientHost_CPU_0"/>
  <Arc FromNode="Init" ToNode="ClientHost_TERMINAL"/>
  <Arc FromNode="ClientHost_TERMINAL" ToNode="Fini"/>
```

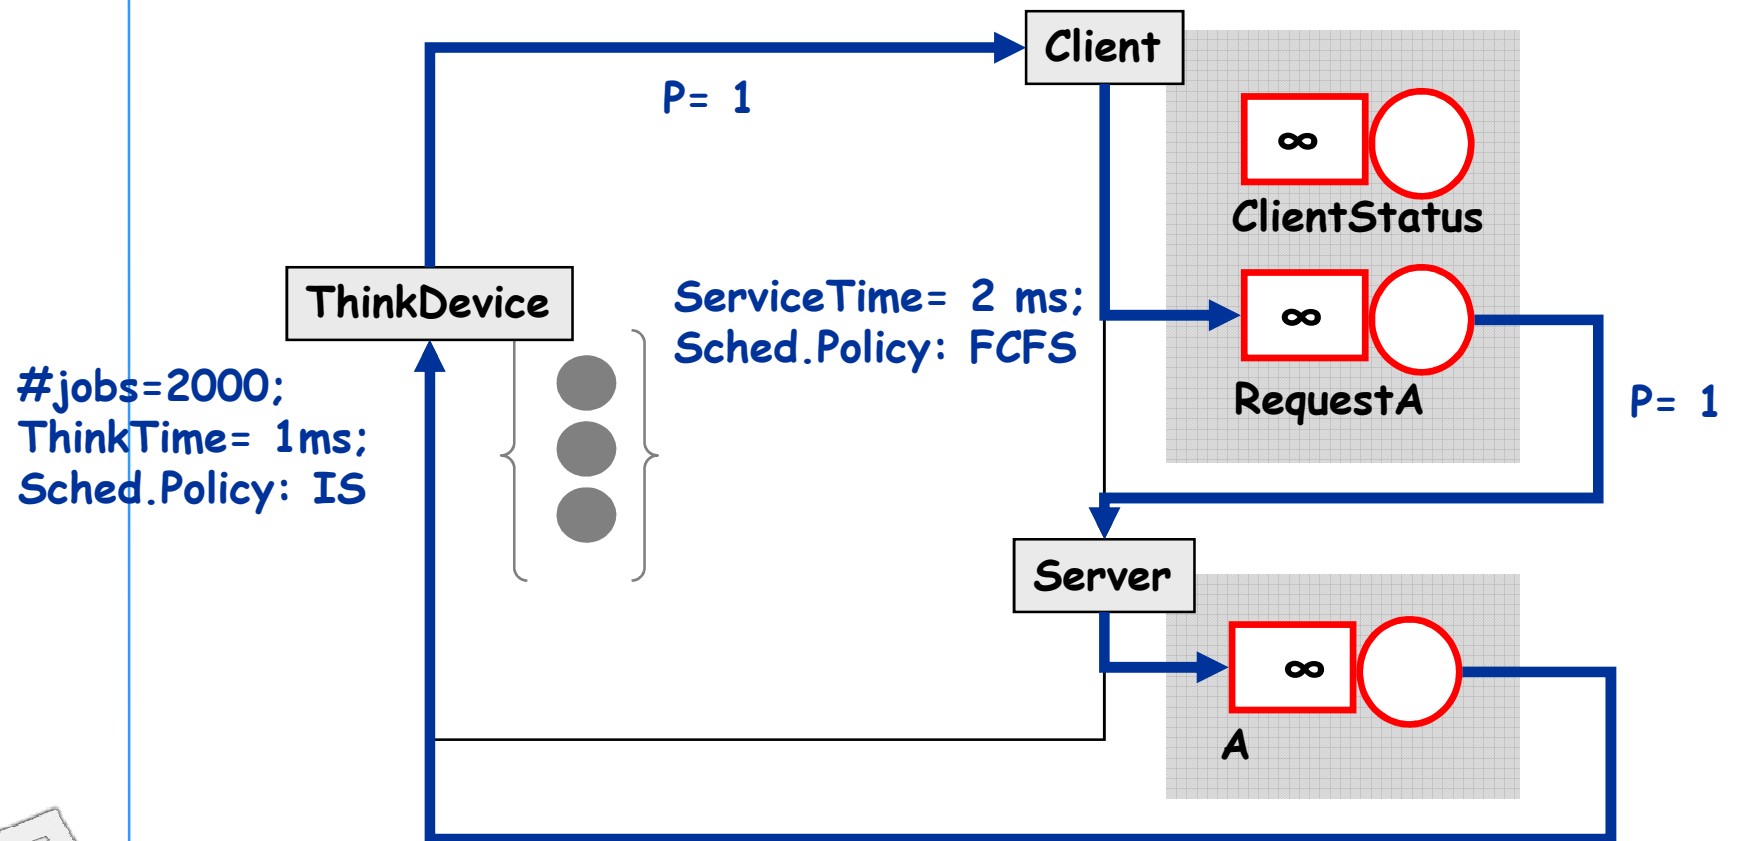

Example 1: resulting Analysis Model

- SAPONE: QNM (pmif' format)

Example 1: resulting Analysis Model

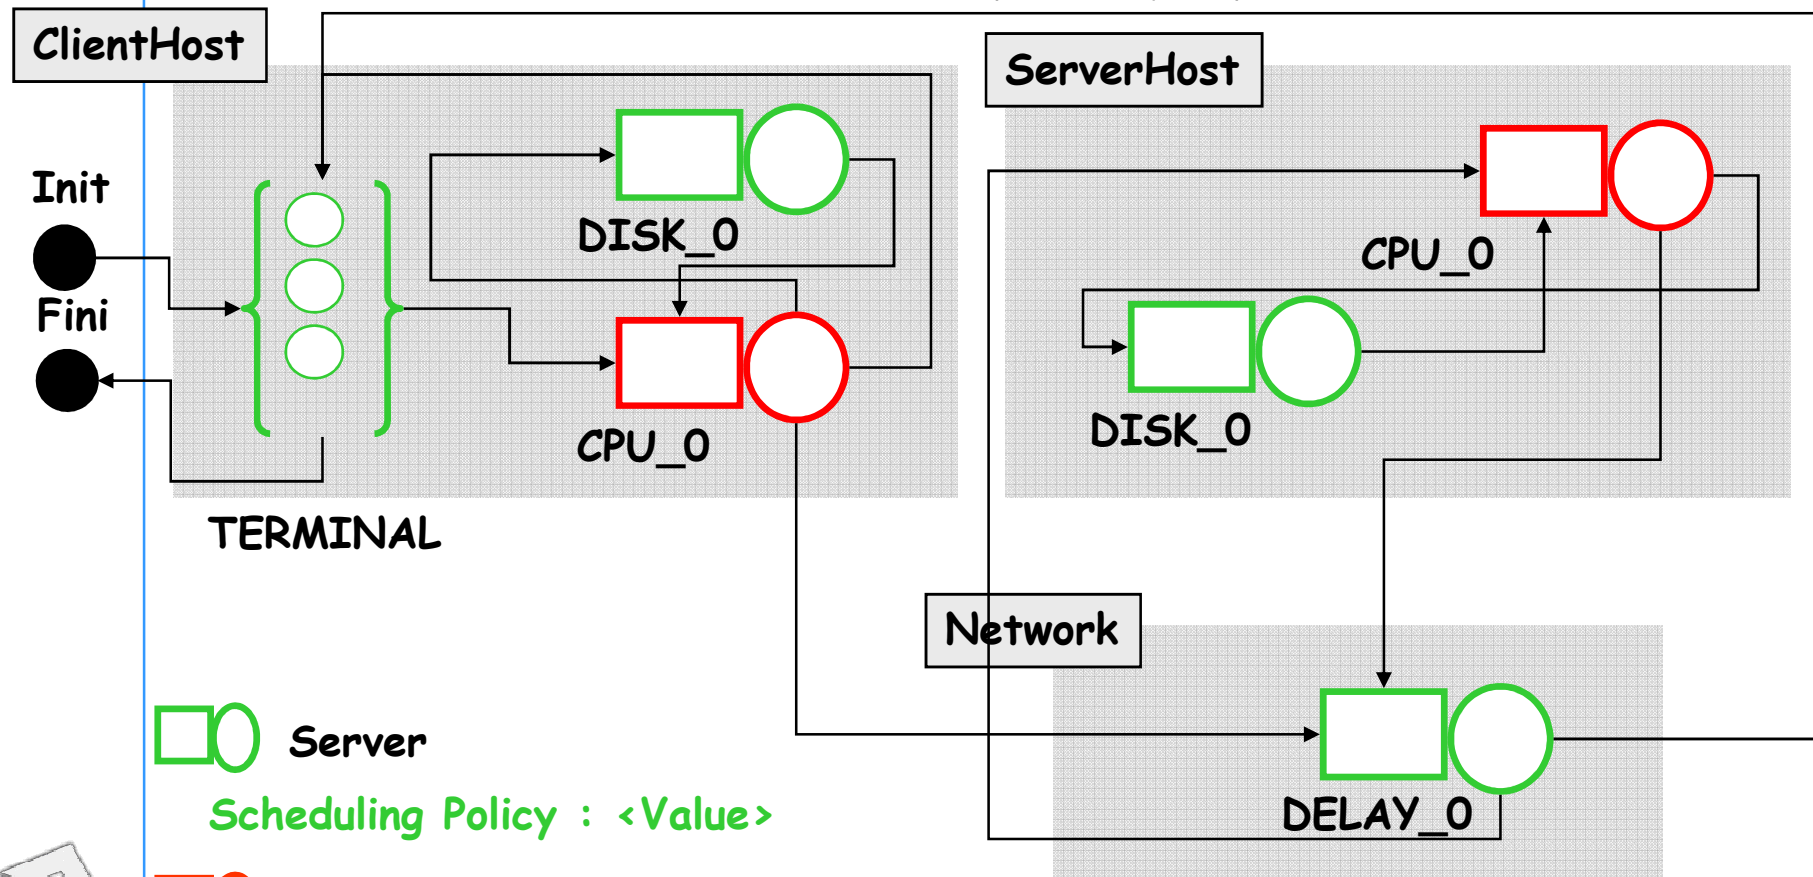

- SAPONE: QNM (pmif' format)

- Workload: FunctionalityA

Example 1: resulting Analysis Model

- PRIMAUML: EQNM topology (pmif format)

 Server

Scheduling Policy : <Value>

+ ServiceTime : <Value>

MOSQUITO - Model driven conStruction of QUeuIng neTwOrks

Example 1: resulting Analysis Model

- PRIMAUML: meta Execution Graph (EG) (spmif)

ProjectName: TestSystem

PerformanceScenario: <ModelName>_General NumberOfJobs = 100

Main EG

ExecutionGraph1

Example 1: resulting Analysis Model

- PRIMAUML: instance Execution Graph (spmif)

ProjectName: TestSystem

PerformanceScenario: <ModelName>_General NumberOfJobs = 100

Main EG

ExecutionGraph1

Sw resource: WorkUnit
(sw2hw mapping)

Devices : AmountOf(hw)Service

Client_CPU_0 : a
Client_DISK_0: b
Server_CPU_0: c
Server_DISK_0: d

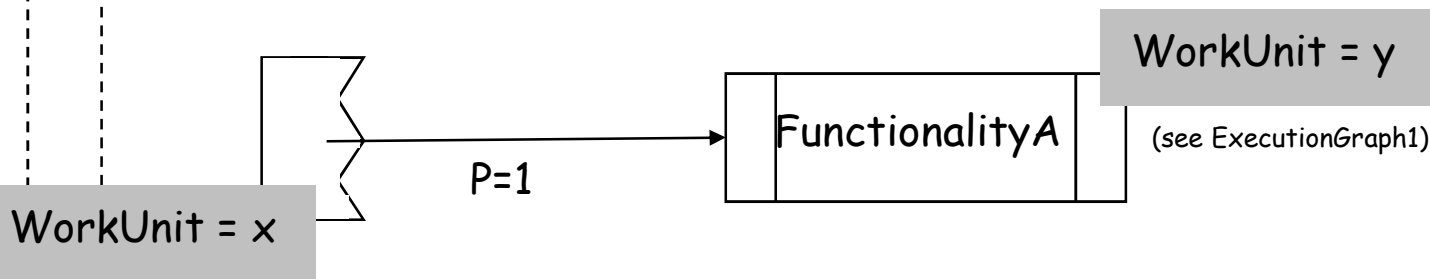

Example 1: resulting Analysis Model

- PRIMAUML: instance Execution Graph (spmif)

ProjectName: TestSystem

PerformanceScenario: <ModelName>_General NumberOfJobs = 100

Main EG

ExecutionGraph1

Sw resource: WorkUnit
(sw2hw mapping)

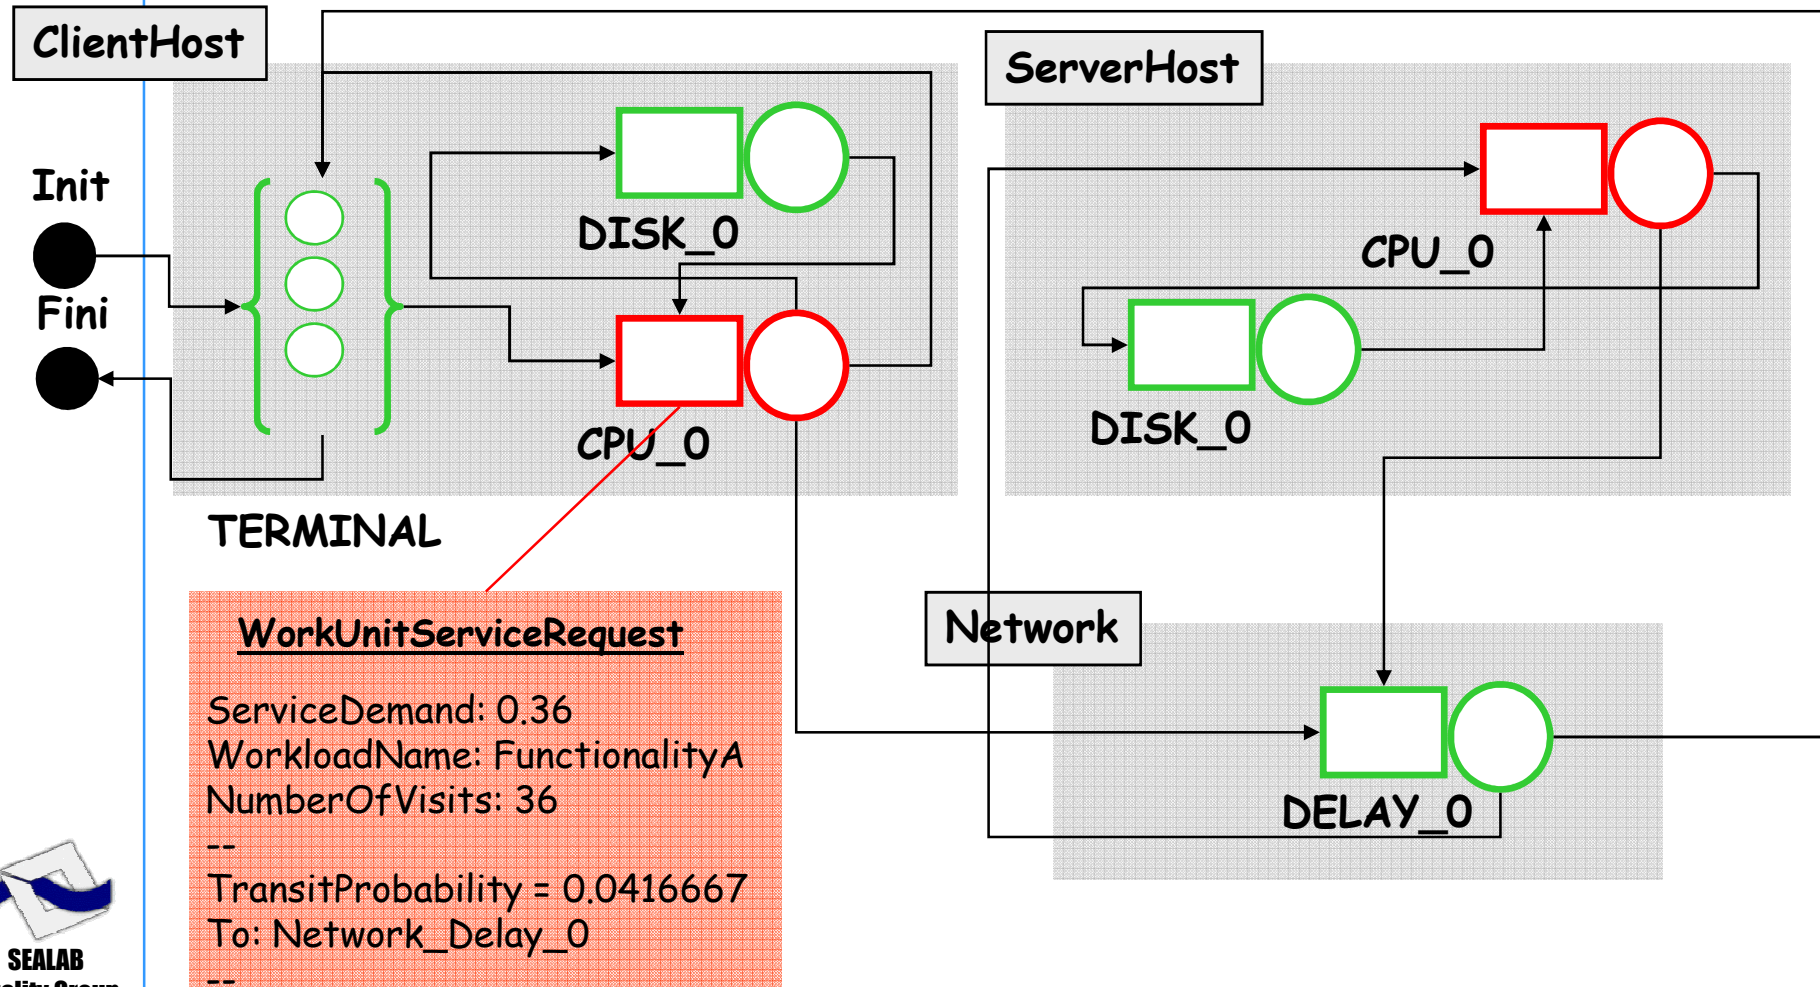

Devices : AmountOf(hw)Service

Client_CPU_0 : a
Client_DISK_0: b
Server_CPU_0: c
Server_DISK_0: d

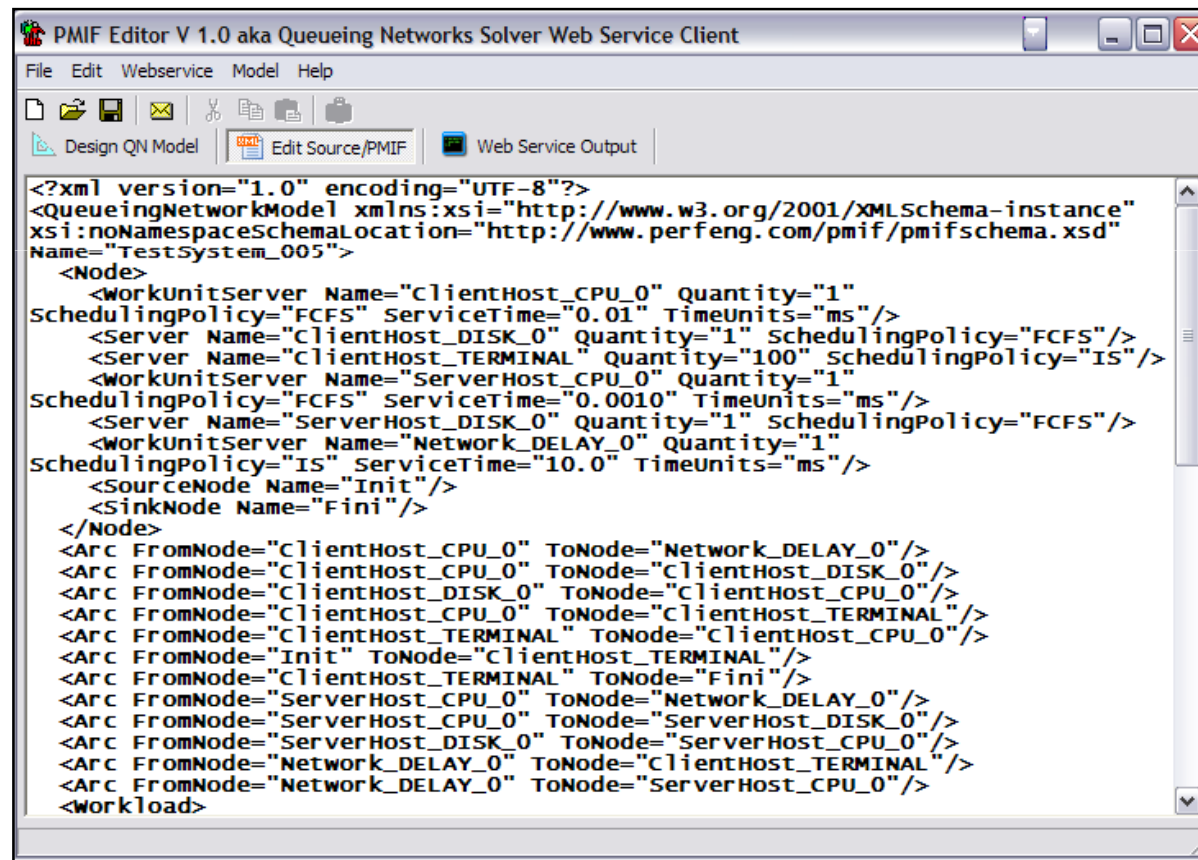

Example 1: resulting Analysis Model

- PRIMAUML: Parameterized EQNM (pmif format)

Example 1: MOSQUITO- WEASEL (working)

- **Step 8: Open PMIF Editor and load the obtained Analysis Model (PRIMAUML)**

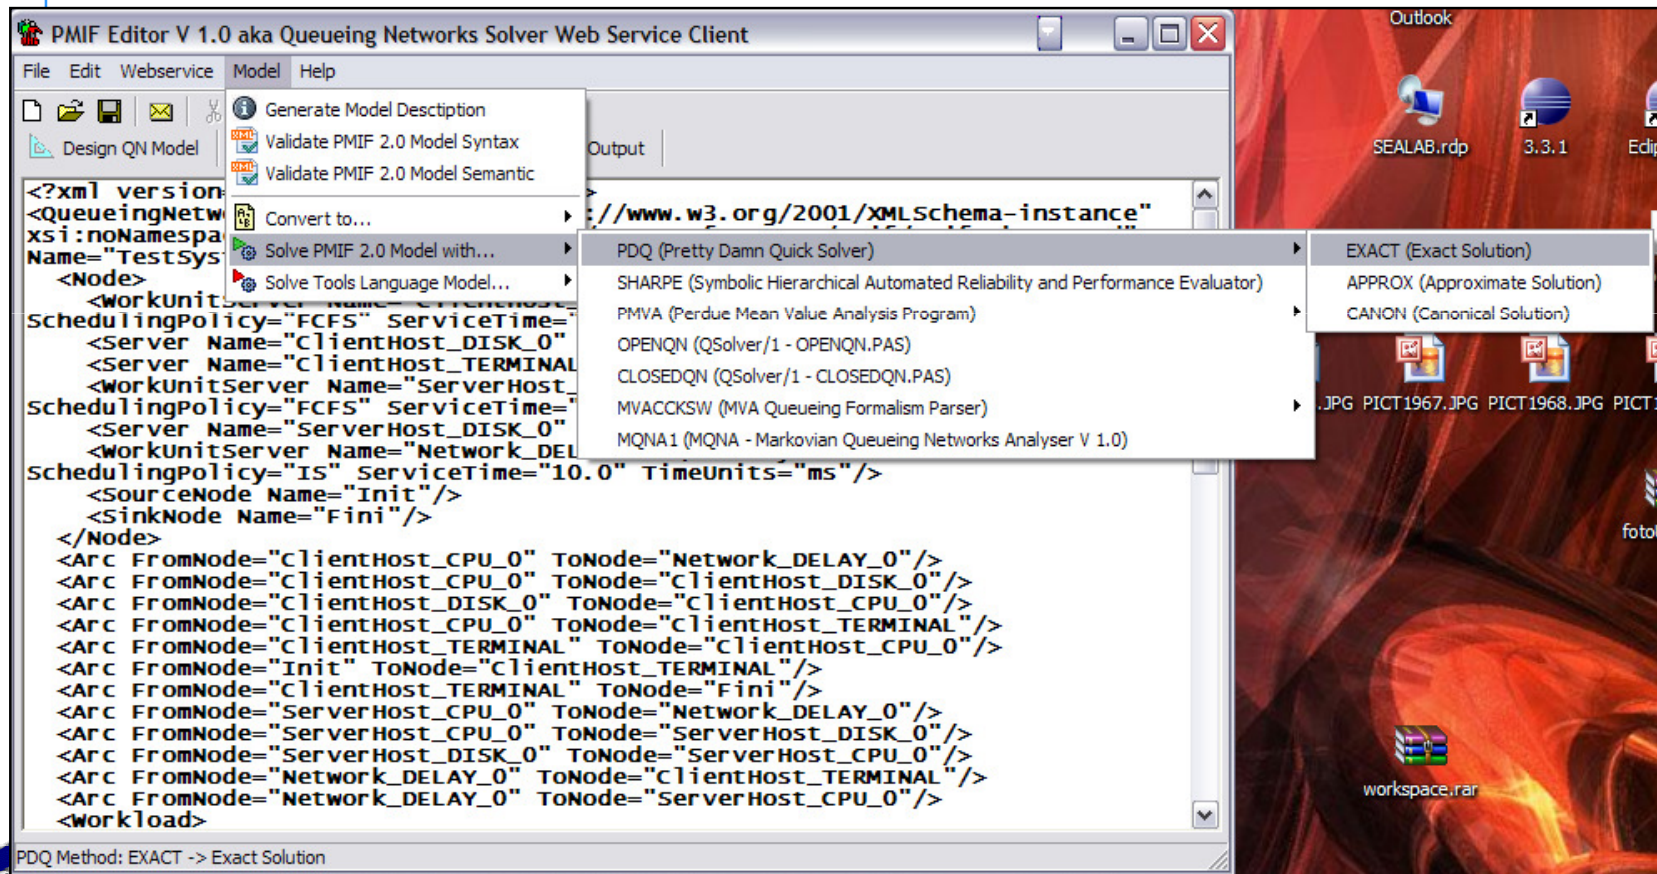

The screenshot shows the PMIF Editor V 1.0 interface. The title bar reads "PMIF Editor V 1.0 aka Queueing Networks Solver Web Service Client". The menu bar includes "File", "Edit", "Webservice", "Model", and "Help". The toolbar contains icons for file operations and a "Web Service Output" button. The main text area displays an XML document with the following content:

```
<?xml version="1.0" encoding="UTF-8"?>
<QueueingNetworkModel xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
xsi:noNamespaceSchemaLocation="http://www.perfeng.com/pmif/pmifschema.xsd"
Name="TestSystem_005">
  <Node>
    <WorkUnitServer Name="ClientHost_CPU_0" Quantity="1"
SchedulingPolicy="FCFS" ServiceTime="0.01" TimeUnits="ms"/>
    <Server Name="ClientHost_DISK_0" Quantity="1" SchedulingPolicy="FCFS"/>
    <Server Name="ClientHost_TERMINAL" Quantity="100" SchedulingPolicy="IS"/>
    <WorkUnitServer Name="ServerHost_CPU_0" Quantity="1"
SchedulingPolicy="FCFS" ServiceTime="0.0010" TimeUnits="ms"/>
    <Server Name="ServerHost_DISK_0" Quantity="1" SchedulingPolicy="FCFS"/>
    <WorkUnitServer Name="Network_DELAY_0" Quantity="1"
SchedulingPolicy="IS" ServiceTime="10.0" TimeUnits="ms"/>
    <SourceNode Name="Init"/>
    <SinkNode Name="Fini"/>
  </Node>
  <Arc FromNode="ClientHost_CPU_0" ToNode="Network_DELAY_0"/>
  <Arc FromNode="ClientHost_CPU_0" ToNode="ClientHost_DISK_0"/>
  <Arc FromNode="ClientHost_DISK_0" ToNode="ClientHost_CPU_0"/>
  <Arc FromNode="ClientHost_CPU_0" ToNode="ClientHost_TERMINAL"/>
  <Arc FromNode="ClientHost_TERMINAL" ToNode="ClientHost_CPU_0"/>
  <Arc FromNode="Init" ToNode="ClientHost_TERMINAL"/>
  <Arc FromNode="ClientHost_TERMINAL" ToNode="Fini"/>
  <Arc FromNode="ServerHost_CPU_0" ToNode="Network_DELAY_0"/>
  <Arc FromNode="ServerHost_CPU_0" ToNode="ServerHost_DISK_0"/>
  <Arc FromNode="ServerHost_DISK_0" ToNode="ServerHost_CPU_0"/>
  <Arc FromNode="Network_DELAY_0" ToNode="ClientHost_TERMINAL"/>
  <Arc FromNode="Network_DELAY_0" ToNode="ServerHost_CPU_0"/>
  <Workload>
```

Example 1: MOSQUITO- WEASEL (working)

- **Step 9: Invoke remote pmif-based QN Solver.**

Example 1: MOSQUITO- WEASEL (working)

- Step 10: Performance Indices**

***** PDQ Model OUTPUTS *****

Solution Method: EXACT

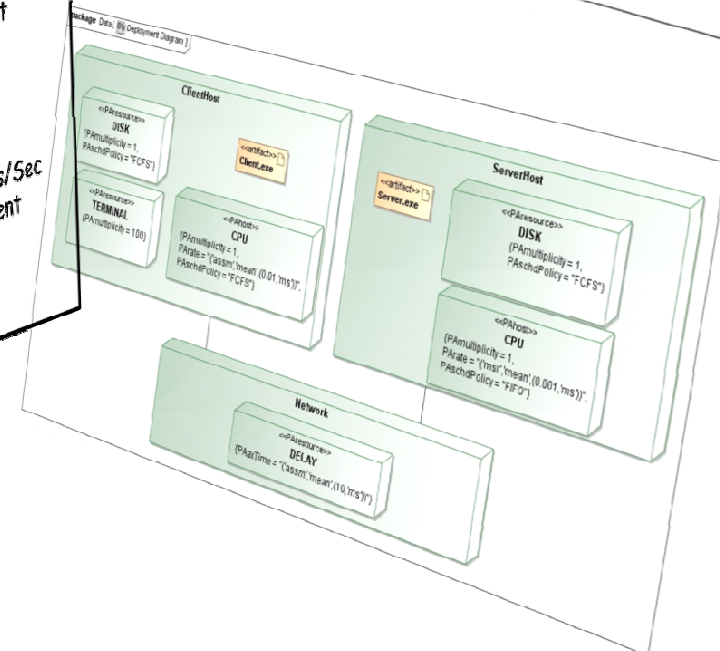

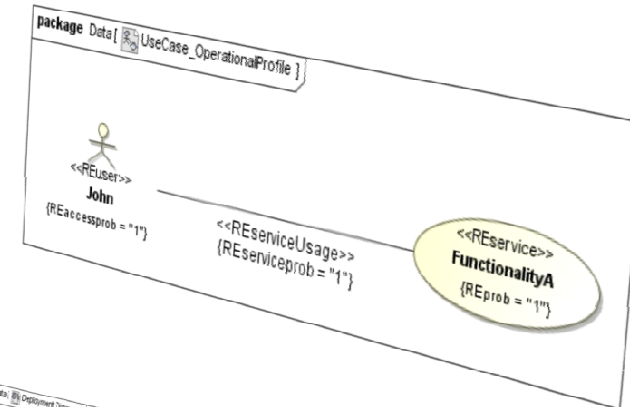

***** SYSTEM Performance *****

Metric	Value	Unit
